## Abstracts

An in-situ specimen holder is an experimental device used to study materials under different environmental conditions. It can support samples under different gas, temperature, pressure and humidity conditions and allows researchers to observe the behavior and properties of materials in real environments. In-situ transmission electron microscopy combines the imaging capabilities of a transmission electron microscope (TEM) with the application of some external stimulus to observe real-time dynamic processes of the sample. Currently, there are many systems and sample holders that can be used to apply different external field stimuli to the sample to study dynamic processes under bias, mechanical strain/deformation, heating, cooling, introduction of gas or liquid environments or simply strong electron beam irradiation.

The global In-situ Specimen Holder market size was estimated at USD 249.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.20% during the forecast period.
