## Abstracts

In-Space Spacecraft Refueling Service refers to an on-orbit propellant resupply service designed to extend the operational lifespan and enhance the maneuverability of satellites, spacecraft, and other orbital assets. This service involves a dedicated "fuel depot" or tanker spacecraft that stores cryogenic or storable propellants (such as hydrazine, xenon, or liquid oxygen/hydrogen) in orbit. Client spacecraft equipped with standardized refueling interfaces rendezvous with the depot, where robotic arms and automated transfer systems perform safe and precise fluid coupling. This capability enables missions such as orbit raising, station-keeping, debris avoidance, and interplanetary trajectory adjustments without being constrained by initial launch fuel limits. By reducing the need for redundant propellant reserves at launch, it lowers mission costs, increases payload capacity, and promotes sustainable space operations by mitigating debris through end-of-life deorbiting. Ultimately, it serves as a foundational technology for cislunar logistics and deep space exploration.

The global In-Space Spacecraft Refueling Service market size was estimated at USD 564.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.80% during the forecast period.
