Abstracts

In wheel electric motors, also known as hub motors, are integrated motor systems installed directly within the wheel hub of a vehicle, replacing conventional drivetrain components such as transmissions, drive shafts, and differentials by combining propulsion, braking, and suspension functions into a single compact unit. These motors utilize electromagnetic principles to generate torque directly at the wheels, offering advantages in efficiency, packaging flexibility, and vehicle dynamics by enabling individual wheel control. They are primarily used in electric vehicles (EVs), including passenger cars, electric bicycles, scooters, and commercial vehicles, and can be categorized into radial flux and axial flux designs, with variations in power output, cooling mechanisms, and integration complexity influencing their suitability for different applications.

The global In Wheel Electric Motors market size was estimated at USD 367.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 16.25% during the forecast period.
