Report Overview:

Polio vaccines can be classified into two types: the inactivated polio vaccine (IPV) and oral polio vaccine. Oral polio vaccine is more active than IPV as it has both weakened and live poliovirus. Inactivated polio vaccine is a vaccine prepared from suspension of inactivated (killed) poliovirus strains with formalin. It is an injectable vaccine that can either be given alone or with other vaccines. IPV has the ability to provide serum immunity against all the three types of poliovirus and consequent protection against paralytic poliomyelitis. The oral polio vaccine has the risk of transmission through human waste, causing the regulatory bodies to shift their demand towards IPV. Inactivated polio vaccines (IPV) have now been introduced into all countries' routine immunization programmes, which are strengthening the fight to eradicate wild poliovirus (WPV).

The Global Inactivated Polio Vaccine Market Size was estimated at USD 717.29 million in 2023 and is projected to reach USD 928.75 million by 2029, exhibiting a CAGR of 4.40% during the forecast period.
