Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Inactive Diluent competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, the global production of inactive diluents was 982,500 tons, with an average price of US\$1,375 per ton. Inactive diluent, also known as non-reactive diluents or physical diluents, do not participate in the chemical reaction during the curing process of resins or coatings. Their main function is to reduce the concentration of reactants, lower the viscosity of the system, improve reaction conditions, or increase reaction efficiency, making the resin or coating easier to mix, apply, or process. They typically possess properties such as inactivity, stability, and inertness. Non-reactive diluents completely evaporate during the curing process or remain as fillers in the material after curing, but they do not affect the chemical structure of the material, nor do they affect the reaction mechanism or the properties of the products. The upstream of inactive diluents mainly consists of epoxy resin monomers, plasticizers, alcohol and ester solvents, and basic chemical raw materials. Representative suppliers include Wanhua Chemical, ExxonMobil, and Tosoh Chemical. Downstream customers are concentrated in industries that require viscosity adjustment but do not participate in the curing reaction, including UV coating manufacturers, epoxy flooring material companies, and composite resin system manufacturers. Typical customers include AkzoNobel's UV coatings business, BADF flooring materials, and Zhongjian Technology's composite resin division. Downstream applications focus on improving application flowability, reducing system viscosity, adjusting film-forming properties, and reducing costs by adding inactive diluents. This is particularly evident in floor coatings, wood UV coatings, fiberglass prepregs, and adhesives, where it can improve workability and reduce the irritation and photosensitivity issues associated with reactive diluents, enhancing

product stability and safety. Industry trends show a shift towards low-odor, low-VOC, high-boiling-point, and environmentally friendly inactive diluents. Driving factors include environmental regulations promoting the widespread adoption of water-based and low-VOC systems, the accelerated adoption of UV curing leading to increased demand for differentiated diluent systems, and the composite materials industry's increasing reliance on controllable viscosity systems. The main obstacles lie in the high cost of some high-performance, low-VOC, inactive diluents, which are more price-sensitive compared to traditional solvents. Furthermore, the compatibility verification cycle between diluents and different resin systems is lengthy, and some specialty resin systems still require dedicated formulations, limiting rapid product substitution. Additionally, some downstream customers are increasingly demanding improvements in the safety and volatility of inactive diluents, leading to significant R&D investment. Single-line annual production capacity is 5,000-8,000 tons, with an overall industry gross profit margin of 15-25%.

The global Inactive Diluent market size was estimated at USD 1351.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
