Report Overview

Indan (CAS 496-11-7) is a bicyclic hydrocarbon consisting of a benzene ring fused to a cyclopentane ring, primarily used as an intermediate in the synthesis of fine chemicals, pharmaceuticals, and fragrances. Its derivatives, such as indanones and indenenes, play a crucial role in producing active pharmaceutical ingredients (APIs), agrochemicals, and specialty polymers. The compound is valued for its structural versatility, enabling modifications that enhance the performance of end products in industries like pharmaceuticals (e.g., antihypertensive drugs) and high-performance materials (e.g., resins and coatings). Demand is driven by R&D in drug development and the growing need for advanced materials, though supply dynamics are influenced by feedstock availability (e.g., benzene and propylene) and regulatory constraints on aromatic hydrocarbons. The market is characterized by niche applications with competition from regional producers in Asia-Pacific (notably China and India), where cost-effective manufacturing dominates, while Western markets focus on high-purity grades for specialized sectors.
