## Abstracts

An indexing chain conveyor is a material handling system that utilizes a continuous loop of chain with attached flights or attachments to transport goods or materials in a controlled, intermittent motion, where the conveyor moves items a predetermined distance before pausing at precise intervals to allow for automated operations such as assembly, inspection, packaging, or sorting. This type of conveyor is engineered for high accuracy, repeatability, and synchronization with other machinery, making it particularly suited for manufacturing and distribution environments that require timed stops and starts rather than continuous flow, such as automotive assembly lines, food processing plants, and warehousing systems where positioning accuracy is critical for efficiency and automation integration.

The global Indexing Chain Conveyor market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
