### Report Overview

Indirect acting solenoid valves are more suited to process industry applications that always have media pressure in a pipeline. In a normally closed state, indirect solenoids operate by allowing a small amount of the process media into an orifice in the inlet port of the valve and into a chamber on top of the diaphragm. Under its own weight and volume, it applies pressure to the diaphragm, which is forced onto the valve seat and reinforcing its closed position. When the solenoid coil is energised, the diaphragm lifts off the seat to open the valve, forcing the process media in the chamber back through the orifice in the inlet port and back into the flow stream, where it continues its journey through the valve and down the pipework. An indirect solenoid valve can also be referred to as a pilot operated solenoid valve, or pilot assist solenoid valve, as the process media acts as a pilot for the valve operation.

The global Indirect Acting Solenoid Valve market size was estimated at USD 201 million in 2023 and is projected to reach USD 314.50 million by 2032, exhibiting a CAGR of 5.10% during the forecast period.
