Report Overview

Indirect calorimetry calculates heat that living organisms produce by measuring either their production of carbon dioxide and nitrogen waste (frequently ammonia in aquatic organisms, or urea in terrestrial ones), or from their consumption of oxygen. Indirect calorimetry is the method by which the type and rate of substrate utilization, and energy metabolism are estimated in vivo starting from gas exchange measurements (carbon dioxide production and oxygen consumption during rest and steady-state exercise). This technique provides unique information, is noninvasive, and can be advantageously combined with other experimental methods to investigate numerous aspects of nutrient assimilation, thermogenesis, the energetics of physical exercise, and the pathogenesis of metabolic diseases.

Global Indirect Calorimeter main players are MGC Diagnostics, COSMED, Vyaire Medical, Microlife, etc. Global top four manufacturers hold a share over 8%. North America is the largest market, with a share above 45%.

The Global Indirect Calorimeter Market Size was estimated at USD 19.02 million in 2021 and is projected to reach USD 23.60 million by 2028, exhibiting a CAGR of 3.13% during the forecast period.
