## Abstracts

Indirect Cooled Magnetron is a magnetron design that separates the cooling medium from the sputtering target through the intermediate wall. Its core feature is that the intermediate wall is used to form a permanent water-vacuum seal structure, which effectively prevents the leakage of the cooling medium caused by "sputtering penetration" of the target. The structure is typically designed with threaded target clamps and anodic shielding, enabling rapid target replacement without auxiliary tools, and is particularly suitable for space-constrained vacuum systems (such as small coaters) to sputter substrates with a larger surface area.

The global Indirect Cooled Magnetron market size was estimated at USD 172.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.
