Abstracts

Indirect Dry Cooling Systems are cooling technologies that indirectly transfer heat to the air through an intermediate heat exchange medium, such as glycol solution, carbon dioxide, or recirculating cooling water. The core principle is that the heat source transfers the heat to the intermediate medium through the surface condenser or heat exchanger, and then the air cools the intermediate medium through the air cooled radiator or dry cooler, and the medium is completely isolated from the air without evaporating water consumption.

The global Indirect Dry Cooling Systems market size was estimated at USD 6127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
