## Abstracts

Indirect Dry Cooling Tower is a cooling equipment based on the principle of non-contact heat exchange, mainly used in water shortage or cold areas of industrial scenes. Its core feature is that the cooling water flows in the closed heat sink tube, and the heat transfer is carried out by contact with the outside air through the tube wall, rather than direct evaporation heat dissipation. The cooling water first absorbs the heat of the process fluid during the circulation process, and then is transported to the cooling coil in the cooling tower, where the heat is taken away by the air convection, and the cooled water is returned to the process system for recycling.

**Market Growth Opportunities and Key Drivers:** The development of indirect dry cooling tower is accelerated under the multiple drives of technological progress, policy support and traditional industrial upgrading needs: through theoretical analysis, numerical simulation and new material application, its energy efficiency ratio has increased by more than 20%; At the same time, global energy conservation and emission reduction policies (such as China's "Made in China 2025" and "14th Five-Year Plan") promote more than 60% of green manufacturing pilot enterprises to adopt efficient cooling technology through subsidies; In addition, high-energy-consuming industries such as electric power and chemical industry accelerate the replacement of traditional wet cooling towers in water-scarce areas and ecologically sensitive areas, forming significant market penetration.

**Market competition pattern:** The dry cooling tower industry presents a pattern of leading enterprises and differentiated competition: The leading domestic enterprises represented by Shanghai Electric and Shuangliang Energy Saving occupy a dominant position by relying on technology accumulation and scale effect, while international brands (such as SPG Dry Cooling and MVM EGI) still maintain their advantages through high-end customized services. The focus of competition is on technological innovation, cost control and service ability, and local enterprises gradually seize the share of international brands through cost-effective and rapid response.

**Challenges and**

future Directions: The dry cooling tower industry currently presents a pattern of multiple drivers and structural challenges: Power (thermal power, nuclear power) and industrial manufacturing are still core application areas, but their development is subject to cost and supply chain pressures (steel and aluminum price fluctuations combined with environmental standards to push up production costs, forcing enterprises to optimize supply chain management), and high-end technology dependence. The future trend focuses on the three major directions of intelligence, modularization and environmental protection, while exploiting international cooperation to open up new growth poles.

The global Indirect Dry Cooling Tower market size was estimated at USD 6127.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.90% during the forecast period.
