## Abstracts

Indirect evaporative cooling units are a type of energy-efficient cooling system that cools air through the process of evaporation without directly humidifying the air being supplied to the indoor space. In these systems, warm outdoor air is passed through a heat exchanger where it is cooled by evaporative cooling, and the cooled air is then used to lower the temperature of the indoor air. Unlike direct evaporative cooling, which adds moisture to the air, indirect evaporative cooling maintains indoor humidity levels while providing a more energy-efficient and environmentally friendly alternative to traditional air conditioning, particularly in dry climates. These units are commonly used in commercial and industrial buildings to reduce cooling costs and energy consumption.

The global Indirect Evaporative Cooling Units market size was estimated at USD 1102.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.50% during the forecast period.
