## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Indirect-fired Rotary Kiln competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Indirect-fired Rotary Kiln production reached approximately 22,466 units, with an average global market price of around US\$ 18,249 per unit. Indirect-fired Rotary Kiln is a specialized thermal processing equipment designed for heating, calcining, pyrolyzing, or sintering materials where direct contact between the heat source (e.g., fuel combustion gases) and the processed material must be avoided? typically to prevent contamination, preserve material purity, or control the reaction environment. Its core structure consists of a horizontally mounted, slightly inclined rotating drum, a surrounding stationary ?heating jacket? or external combustion chamber, and a separate exhaust system for flue gases. Unlike direct-fired rotary kilns (where flame and hot gases flow directly through the drum with the material), indirect-fired models generate heat by burning fossil fuels (natural gas, diesel, propane) or using electric heaters in the external jacket; this heat is then transferred to the drum?s outer wall via radiation and conduction, and subsequently to the material inside the drum through the drum?s inner surface.

The global Indirect-fired Rotary Kiln market size was estimated at USD 410.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.40% during the forecast period.
