Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Indirect-Fired Water Heater competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. An indirect-fired water heater is a hot water heating device that utilizes thermal energy from a separate combustion source to heat domestic water indirectly, without direct combustion occurring inside the water tank. Fuel such as natural gas or diesel is burned in an external burner or boiler, and the generated heat is transferred through a heat exchanger or circulating medium (such as water or steam) to the domestic water storage tank. This configuration is ideal for applications where open flame is undesirable within the tank or where system isolation is required, offering high safety, improved thermal efficiency, and greater control. Indirect-fired water heaters are commonly used in commercial buildings, industrial facilities, hotels, and district heating systems.

The global Indirect-Fired Water Heater market size was estimated at USD 491.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.70% during the forecast period.
