Abstracts

Indirect heating disc dryer is a drying equipment that uses a rotating heating disc to conduct efficient heating of materials. The equipment heats the materials indirectly by passing steam, hot water or heat transfer oil through the jacket and the disc, and continuously turns and stirs the materials by the rotation of the disc to improve the heat transfer efficiency. Due to the indirect heating method, the materials will not directly contact the heat source, effectively reducing dust flying and heat energy loss. It is widely used in low-temperature drying processes in industries such as sludge treatment, chemical industry, food and pharmaceutical industry.

The global Indirect Heating Disc Dryer market size was estimated at USD 503.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
