Abstracts

Indium arsenide (InAs) detectors are semiconductor-based photodetectors that operate in the short-wavelength infrared (SWIR) range, typically between 1-3.8 micrometers, leveraging the narrow bandgap of indium arsenide to efficiently detect light in this spectral region where many conventional silicon-based detectors are ineffective. These devices are characterized by high sensitivity, fast response times, and the ability to operate at near-room temperatures, making them suitable for applications requiring precise infrared detection without the need for extensive cooling systems often associated with other infrared materials like mercury cadmium telluride (MCT). InAs detectors are commonly utilized in spectroscopy, gas analysis, laser-based communication, industrial process monitoring, and military and aerospace systems, where accurate SWIR detection is critical for performance and functionality.

The global Indium Arsenide Detectors market size was estimated at USD 86.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.25% during the forecast period.
