Abstracts

The individually ventilated cage system is an advanced experimental animal breeding system that provides constant fresh air to each animal cage through an independent ventilation structure, while removing exhaust gas and pollutants to ensure a stable experimental environment. The system can effectively control temperature and humidity, air flow rate and air quality, reduce the risk of cross-contamination, and improve the reliability of experimental data. The IVC system usually consists of three parts: a ventilation unit, an IVC cage, and a bracket. It can adopt a positive pressure mode (to protect experimental animals from external contamination) or a negative pressure mode (to prevent the leakage of pathogens that may be carried by experimental animals) to meet different biosafety requirements. In addition, the system can be equipped with a HEPA filter to further improve the cleanliness of the air, and is widely used in biomedical research, drug development, and animal laboratories.

The global Individually Ventilated Cage System market size was estimated at USD 204.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.20% during the forecast period.
