Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Indomethacin Patch competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Indomethacin patch is a topical formulation of the non-steroidal anti-inflammatory drug (NSAID) indomethacin, designed for transdermal delivery to treat localized pain and inflammation. It works by inhibiting cyclooxygenase (COX) enzymes, thereby reducing the production of prostaglandins that cause pain and swelling. The patch provides a sustained release of indomethacin over 12 to 24 hours, offering the benefits of localized action with minimal systemic exposure. It is commonly used to manage conditions such as osteoarthritis, lumbago, muscle strains, and post-traumatic pain. Due to its potent anti-inflammatory effects, indomethacin is typically used in moderate to severe pain cases where other NSAIDs are less effective. Growth is driven by the need for non-opioid, localized pain solutions, especially in aging populations. However, usage is limited by the higher incidence of skin irritation and regulatory restrictions in some countries. Product development is largely concentrated in Japan and parts of East Asia, where topical NSAID patches are widely accepted. Regional breakdown:
