Abstracts

Indoor 5G mmWave small cells are compact, low-power cellular base stations specifically designed to provide high-speed, high-capacity 5G coverage within buildings and enclosed environments by utilizing millimeter wave (mmWave) spectrum frequencies, typically between 24 GHz and 100 GHz. These devices are engineered to address the inherent limitations of mmWave signals, which offer exceptional data throughput and ultra-low latency but suffer from poor penetration through physical obstructions like walls and windows, making them ideal for targeted deployment in high-density areas such as corporate offices, airports, shopping malls, stadiums, and hospitals where traditional macro-network coverage is insufficient.

The global Indoor 5G Mmwave Small Cell market size was estimated at USD 321.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 24.75% during the forecast period.
