Abstracts

An Indoor Environment Monitoring System is a system that is designed to monitor and measure various environmental parameters within an indoor space. These parameters can include temperature, humidity, air quality, CO2 levels, light levels, noise levels, and more. The system typically consists of sensors that are strategically placed throughout the indoor space to collect data on these parameters. The sensors then transmit the data to a central monitoring unit or a cloud-based platform, where it is analyzed and displayed in real-time. The purpose of an Indoor Environment Monitoring System is to ensure that the indoor environment is comfortable, safe, and healthy for the occupants. By monitoring and controlling these parameters, the system can help to prevent issues such as poor air quality, excessive humidity, or inadequate lighting, which can have negative effects on the health and well-being of the occupants. In addition to monitoring and controlling the indoor environment, some systems also offer features such as automated alerts and notifications, data logging and analysis, and integration with other building management systems.

The global Indoor Environment Monitoring System market size was estimated at USD 1305.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
