Abstracts

Indoor positioning software is a technology that allows for the tracking and locating of objects or people within indoor environments, such as buildings, malls, or airports. It uses various techniques, such as Wi-Fi, Bluetooth, or sensor-based technologies, to determine the position of a device or individual within a building. This software typically relies on a network of sensors or beacons placed strategically throughout the indoor space to collect data and provide accurate positioning information. The collected data is then processed and analyzed by the software to determine the location of the device or person in real-time. Indoor positioning software has various applications, including asset tracking, navigation, security, and analytics. It can be used in retail environments to track inventory or guide customers to specific products, in healthcare facilities to locate medical equipment or personnel, or in large venues to provide indoor navigation for visitors.

The global Indoor Positioning Software market size was estimated at USD 7984.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 18.20% during the forecast period.
