Abstracts

Induction brazing is a process used to join two or more metal components together using the principle of induction heating. In this process, a high-frequency alternating current (AC) is passed through a copper coil, which generates an alternating magnetic field. When a metal component is placed within this magnetic field, eddy currents are induced in the metal, causing it to heat up rapidly due to resistance to the flow of electrical current. An induction brazing machine is a specialized piece of equipment used to perform induction brazing processes. It employs the principle of electromagnetic induction to generate heat in the metal components being brazed, allowing for precise and controlled heating of the joint area. With the development of electric vehicles (EV) and renewable energy technologies, induction brazing machines are widely used in battery packs, motor components, and thermal management systems. With the advancement of technology and the growth of market demand, brand competition for induction brazing machines is becoming increasingly fierce. In order to attract customers, many suppliers have adopted a price reduction strategy, resulting in intensified market price competition. The development of high-frequency induction heating technology has improved heating efficiency and control accuracy, which helps to improve brazing quality and production efficiency.

The global Induction Brazing Systems market size was estimated at USD 110.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
