Abstracts

An induction motor is a motor that combines an induction motor and a reducer. It works on the principle of electromagnetic induction and is suitable for applications that require reducing speed and increasing torque. An induction motor generates a rotating magnetic field between the stator and the rotor through electromagnetic induction, which in turn drives the rotor to rotate. On this basis, the induction motor is also equipped with a reducer, which can effectively reduce the speed of the motor and increase the output torque, thereby increasing the load capacity. It is widely used in automation equipment, conveyor belts, cranes, robots and other occasions that require low speed and high torque output.

The global Induction Gear Motor market size was estimated at USD 14200.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.10% during the forecast period.
