Abstracts

Inductive angle encoders are non-contact position sensors that utilize electromagnetic induction to measure angular displacement with high precision and reliability, typically consisting of a rotor and stator that interact through inductive coupling to generate signals proportional to rotational movement, offering advantages such as robustness in harsh environments, immunity to contaminants like dust and oil, and long operational life due to the absence of physical contact or optical components. These devices are widely used in industrial automation, robotics, aerospace, and automotive applications where accurate angular feedback is critical, competing with optical and magnetic encoders by providing a middle ground in terms of cost, durability, and performance under demanding conditions.

The global Inductive Angle Encoders market size was estimated at USD 550.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
