## Abstracts

An inductive industrial rotary encoder is a sensor that uses the principle of electromagnetic induction to detect rotational motion and convert it into an electronic signal. It usually consists of a rotating disk, a sensor, and a signal processing circuit. As the disk rotates, the sensor senses the change in the magnetic field and generates a pulse signal proportional to the rotation angle or speed. These signals can be used for applications such as position measurement, speed control, or motion detection. Inductive industrial rotary encoders are widely used in automation, robotics, machine tools, precision measurement, and various types of industrial equipment. Because of their durability, high accuracy, and strong anti-interference ability, they are particularly suitable for precise motion control in harsh environments.

The global Inductive Industrial Rotary Encoder market size was estimated at USD 1051.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
