Report Overview

An inductive linear displacement sensor is a device that uses the principle of electromagnetic induction to detect or measure objects. When current flows through an inductor, an inductor creates a magnetic field; or, when the magnetic field passing through it changes, current flows through a circuit containing the inductor. An inductive linear displacement sensor is a device used to monitor and measure linear position. They can also be called linear position sensors or linear sensors. They are available in different sizes to measure different stroke lengths.
