Abstracts

Inductive linear encoders are non-contact position sensing devices that utilize electromagnetic induction principles to measure linear displacement with high accuracy and reliability; they operate by detecting changes in inductive coupling between a fixed reader head and a moving scale, typically made of conductive materials, and are distinct from optical or magnetic encoders due to their immunity to contaminants like dust, oil, and coolant, making them particularly suited for harsh industrial environments such as machine tools, automation systems, and heavy machinery where precision, durability, and resistance to environmental factors are critical.

The global Inductive Linear Encoders market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
