Abstracts

Inductive proximity switch sensor is a non-contact detection device based on the principle of electromagnetic induction. It outputs signals by detecting the change in magnetic field caused by the approach of metal objects. It generates an alternating electromagnetic field through an internal high-frequency oscillator. When a metal object enters the magnetic field, eddy currents are induced on the surface of the object, resulting in energy loss of the oscillator, thereby triggering the sensor to output signals. Inductive proximity switch sensor includes oscillator, signal processing circuit, detection coil and output circuit. It has the characteristics of high reliability and fast response speed. It is widely used in industrial automation, automobile manufacturing, mechanical equipment positioning, safety protection and other fields.

The global Inductive Proximity Switch Sensor market size was estimated at USD 1427.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
