### Report Overview:

An inductive sensor is a device that uses the principle of electromagnetic induction to detect or measure objects. An inductor develops a magnetic field when a current flows through it; alternatively, a current will flow through a circuit containing an inductor when the magnetic field through it changes. This effect can be used to detect metallic objects that interact with a magnetic field. Non-metallic substances such as liquids or some kinds of dirt do not interact with the magnetic field, so an inductive sensor can operate in wet or dirty conditions.

The Global Inductive Sensor Market Size was estimated at USD 1208.17 million in 2023 and is projected to reach USD 1949.39 million by 2029, exhibiting a CAGR of 8.30% during the forecast period.
