Abstracts

An air classifier is an industrial machine which separates materials by a combination of size, shape, and density. It works by injecting the material stream to be sorted into a chamber which contains a column of rising air. Inside the separation chamber, air drag on the objects supplies an upward force which counteracts the force of gravity and lifts the material to be sorted up into the air. Due to the dependence of air drag on object size and shape, the objects in the moving air column are sorted vertically and can be separated in this manner. Global key players of Industrial Air Classifier include Metso, NETZSCH and Hosokawa Micron, etc. The top three players hold a share over 56%. North America is the largest market, has a share about 38%. In terms of product type, Centrifugal Air Classifier is the largest segment, occupied for a share of about 28%, and in terms of application, Aggregates has a share about 38 percent.

The global Industrial Air Classifier market size was estimated at USD 571.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.50% during the forecast period.
