## Abstracts

Industrial Computed Radiography (CR) is a non-destructive testing (NDT) technique used to inspect and evaluate the internal structures of materials and components in various industrial applications. It is a digital imaging method that has largely replaced traditional film-based radiography in many sectors. Industrial CR involves the use of phosphor imaging plates to capture X-ray images, which are then processed digitally for analysis and interpretation. Ongoing developments in digital detector technologies are likely to enhance the sensitivity and resolution of CR systems. This includes improvements in the design of phosphor imaging plates and the integration of high-performance detectors for improved image quality.

The global Industrial Computed Radiography market size was estimated at USD 407.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.90% during the forecast period.
