Report Overview

The Aluminum Conductor Steel-Reinforced (ACSR) cable is a type of electrical conductor commonly used in overhead power lines for its high conductivity and mechanical strength. The ACSR consists of an aluminum conductor that surrounds a steel core, which provides strength and support, enabling the cable to withstand high mechanical loads, particularly in long-distance transmission and challenging environmental conditions. The primary function of ACSR cables is to conduct electricity efficiently while also providing mechanical stability for power transmission lines.

The steel core in ACSR cables ensures that they can endure higher tensions, which makes them ideal for use in areas with long spans between support towers or in regions with high wind loads. The aluminum outer conductor offers high conductivity, making it well-suited for power transmission over long distances. The combination of aluminum and steel helps strike a balance between electrical conductivity and mechanical strength, offering reliability and efficiency for electrical grid operators and power transmission systems.
