## Abstracts

The industrial cross field microwave magnetron emission source adopts the continuous wave magnetron as the microwave oscillation source. The magnetron is a kind of orthogonal field microwave electron tube, which is an electric vacuum device used to generate microwave energy. In the diode in the magnetic field, the electrons in the tube interact with the high-frequency electromagnetic field under the control of the mutually perpendicular constant magnetic field and the constant electric field, and convert the energy obtained from the constant electric field into microwave energy, so as to achieve the purpose of generating microwave energy. The selective heating application in the microwave magnetron minimizes scorching, overheating, over-processing and guarantees a pollution-free atmosphere as there are no combustion by-products and provides instant control over heating. Ships, submarine periscopes, and enemy aircraft can be spotted in the dark by using microwave magnetrons. Microwaves in radar equipment are used extensively by navies and militaries of many countries around the world. Rising number of nuclear households, rising living standards, and rising demand for ready-to-eat and frozen meals are some of the factors contributing to the market growth. Convection microwave ovens are commonly used in commercial establishments such as hotels and restaurants where large quantities of food need to be defrosted and reheated. Economic factors such as rising awareness about different cooking appliances, rising disposable income of consumers, rising population, rising catering contracts for seminars, large events, and other social gatherings, and strong growth in the hospitality industry are expected to drive microwave oven sales Magnetrons for some time to come.

The global Industrial Cross Field Microwave Magnetrons market size was estimated at USD 610.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
