Report Overview

Displacement is a quantity related to the orientation change of an object during motion, and the measurement method of displacement covers a wide range of scales. Displacement sensors are often used in industrial production. Displacement sensors, also known as linear sensors, are linear devices that belong to metal induction. The function of displacement sensors is to convert various measured physical quantities into electrical energy, and output different electrical energy according to the size of the displacement. The magnitude of the displacement of the signal, and then the magnitude of the displacement can be determined. The displacement sensor is mainly used to measure distance. The difference between it and the proximity sensor is that the displacement sensor is a precision measurement with an accuracy range between nm and mm, and is used for precision measurement in industry or laboratories. The proximity sensor is an inaccurate indicator, and can only measure two indicators, whether it is close or far away, and is used for primary detection in industry. The statistical scope of this article does not include proximity sensors.

The global Industrial Displacement Sensor market size was estimated at USD 2838 million in 2023 and is projected to reach USD 4594.99 million by 2032, exhibiting a CAGR of 5.50% during the forecast period.

North America Industrial Displacement Sensor market size was estimated at USD 810.87 million in 2023, at a CAGR of 4.71% during the forecast period of 2024 through 2032.
