Abstracts

Polyaluminum chloride, abbreviated as PAC. Commonly known as basic aluminum chloride or coagulant, it is a water-soluble inorganic polymer between $ALCL_3$ and $AL(OH)_3$, with a chemical formula of $[AL_2(OH)_nCL_{6-n}]_m$, where m represents the degree of polymerization and n represents the neutrality of PAC products. The color is yellow or light yellow, dark brown, dark gray resin like solid. This product has strong bridging and adsorption properties, and during the hydrolysis process, physical and chemical processes such as coagulation, adsorption, and precipitation occur. The fundamental difference between polyaluminum chloride and traditional inorganic coagulants is that traditional inorganic coagulants are low molecular weight crystalline salts, while polyaluminum chloride's structure is composed of multi carboxyl complex compounds with diverse forms. It has a fast flocculation and precipitation rate, a wide range of applicable pH values, and is non corrosive to pipeline equipment. Its water purification effect is obvious, and it can effectively support the removal of color SS, COD, BOD, arsenic, mercury and other heavy metal ions in water. This product is widely used in drinking water, industrial water and sewage treatment fields.

The global Industrial Grade Poly Aluminum Chloride market size was estimated at USD 1509.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.30% during the forecast period.
