Report Overview

Industrial Leaded Disk Varistors are electronic components used to protect sensitive circuits from voltage surges or transients. They consist of a ceramic disk with metal contacts on both sides and a layer of zinc oxide, which acts as a semiconductor material that allows current to flow in both directions but offers high resistance to normal circuit operation. When a transient voltage exceeds a predetermined level, the varistor quickly changes to a low-resistance state, shunting the excess voltage away from the protected circuit.

The global Industrial Leaded Disk Varistors market size was estimated at USD 485.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
