Report Overview

Magnetic fluid sealing technology is developed on the basis of magnetic fluid. When the magnetic fluid is injected into the gap of the magnetic field, it can fill the entire gap, forming a 'liquid O-ring seal.' The function of the magnetic fluid sealing device is to transfer the rotating motion to the sealed container, which is often used for vacuum sealing. The magnetic fluid seal is composed of a non-magnetic seat, a bearing, a magnetic pole, a permanent magnet, a magnetic shaft and a magnetic fluid. Under the action of a uniform and stable magnetic field, the magnetic fluid is filled in the set space, and a multi-level 'O-shaped sealing ring' is established to achieve the sealing effect. It can be used in monocrystalline silicon furnaces, vacuum brazing furnaces, vacuum melting furnaces, Sealing of vacuum equipment such as chemical vapor deposition, ion plating, liquid crystal regeneration, etc., as well as sealing of high temperature and high-pressure equipment and equipment with high environmental protection requirements.
