## Abstracts

Industrial Multimedia Filter is a type of water filtration system used in industrial applications to remove a wide range of contaminants from water, typically through a multi-layered filtration process. It consists of several layers of different filtration media, such as sand, gravel, anthracite, and other granular materials, each designed to capture specific particles and impurities. As water flows through these layers, larger particles are filtered out by the coarser layers, while finer particles, such as silt, sediment, and organic matter, are removed by the finer layers. The multimedia filter is commonly used in industries like manufacturing, mining, water treatment, and food processing, where high volumes of water need to be treated for reuse or discharge. This filtration method is efficient, providing high flow rates and consistent filtration performance, making it ideal for large-scale operations requiring effective water purification and treatment.

The global Industrial Multimedia Filter market size was estimated at USD 706.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
