## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Industrial Potassium Dichromate competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Industrial potassium dichromate ( $K_2Cr_2O_7$ ) is a highly oxidizing inorganic salt with the appearance of orange-red crystals. It is widely used in various industrial fields, including metal surface passivation, chemical oxidation reactions, leather tanning, and glass and ceramic coloring. It is produced from chromite as the primary raw material through high-temperature oxidative roasting and acidification crystallization, with potassium sulfate as a by-product. Global production is primarily concentrated in China and India. Due to the high environmental risks of hexavalent chromium, its use is being gradually restricted in Europe and the United States, driving the industry towards trivalent chromium substitution and recycling technologies. Currently, the gross profit margin for standard industrial-grade products is approximately 15-25%, while high-purity products used in aviation, electronic chemicals, and other applications can reach margins exceeding 40%. Overall, the potassium dichromate industry is evolving from a traditional bulk chemical industry toward high-purity, environmentally friendly products. In 2024, global industrial potassium dichromate production reached approximately 20,000 tons, with an average global market price of around US\$ 3,000 per tons.

The global Industrial Potassium Dichromate market size was estimated at USD 64.51 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.60% during the forecast period.
