Report Overview

There are two types of Potato Fryers, which are Batch fryers and Continuous Fryers. Batch fryers are used exclusively for hard bite, slow cooked potato chips due to their unique temperature profile. The high-moisture content of potatoes requires a specially designed batch fryer. Potato-specific batch fryers use a kettle of static, hot oil – direct-heated by a gas burner firing under the fryer pan or by heat-transfer tubes immersed in the oil. These tubes can be heated by a gas burner, steam, or thermal fluid. There are numerous designs of continuous fryers, varying in heat load, product handling, oil filtration, and production-capacity, however all commonly cook a continuous flow of product. Potato products such as potato chips, sticks, potato co-products such as tots and patties, french fries, or batter-coated fries require an externally-heated continuous fryer design due to the large amount of moisture that must be boiled off during the frying process.

Unique characteristics and production capacities of different potato products have prompted the development of specially-designed continuous fryer systems, including Multi-Zone Fryers, Multi-Stage Fryers, Thermal-Fluid-Heated Fryers, and Vacuum Fryers.
