### Report Overview

Industrial refrigeration isn't air conditioning—it goes beyond that, both in scale and in the little details. Industrial refrigeration can be defined as the equipment and accessories projected to remove heat from large-scale processes or materials, lowering the temperature to a desired value. Depending on different parameters like the production scale, temperature difference, accuracy or expected temperature, there are multiple methods used to apply industrial refrigeration. Industrial refrigeration has been of paramount importance since the early years of the twentieth century. Historically, industries like Food and Beverages, Pharmaceuticals or Petrochemicals, achieved important developments thanks to systems indicated for reducing the temperature of their products or processes, or conserving them in optimal conditions to avoid safety issues. In industries where bioprocesses are involved, products and processes have to be developed and stored in ideal conditions to achieve the maximum yield in reactions, or to avoid the decay of products. Sometimes refrigeration is necessary to maintain safe conditions in the process or product to avoid accidents or chain reactions, e.g. in compounds with a low boiling point. In addition, cooling may be applied to have an adequate environment for people or machines to work, like in industries where high amounts of heat are produced or for equipment that needs to dissipate the heat generated.
