Report Overview:

Industrial robots can generally be divided into four parts. Namely mechanical part, control part. The sensory part and the recognition part. The sensory part means that the robot USES sensors to absorb information from the outside world and transmit it to the recognition part. The recognition part feeds back the recognized information to the control part, and then feeds back to the sensitive part for operation control. Sensors play an important role in the construction of robots and are the key to the performance of robots. Robot sensors are different from industrial sensors which are widely used. They have higher requirements on the types of sensor information and intelligent processing. Both research and industrialization. All need to have a variety of subjects specialized technology and advanced craft equipment as a support. Robot sensors mainly include robot visual sense, tactile sense, proximity sense, distance sense, posture sense, position sense and other sensors. - the use and development of aspect sensors improve the level of robots and promote the deepening of robot technology; On the other hand, because of many difficulties in sensing technology, the development of robot is restrained and affected. To what extent the intelligent robot can develop in the future, the sensor will be one of the important keys. Therefore, only the development of high performance sensors can make the robot have good intelligent interface function.

The Global Industrial Robot Sensors Market Size was estimated at USD 3662.55 million in 2023 and is projected to reach USD 5136.86 million by 2029, exhibiting a CAGR of 5.80% during the forecast period.
