### Report Overview

A Signal Converter is a device that converts signals from sensors to industrial current signals, converts analog input signals to analog output signals, normalizes signals, or isolates signals.

The electronic signals that are detected by a detector are different in nature because of differences in the data that was measured (e.g., temperatures, pressures, and voltages). This makes it difficult to input the data directly into control circuits. Therefore, it is necessary to convert or normalize the data to a signal form that is easy to use.
