## Abstracts

Industrial SPAD components are photoelectric detection devices with single-photon detection capabilities. The working principle of industrial SPAD components is based on the avalanche multiplication effect. When a photon is absorbed by the SPAD, an electron-hole pair is generated in the depletion region. Since the depletion region has a high electric field strength, the newly generated electron-hole pairs gain energy under the action of the electric field and collide with lattice atoms to generate more electron-hole pairs. This process is called the avalanche multiplication effect, which can generate a large number of carriers in a very short time, thereby triggering a detectable electrical signal.

The global Industrial SPAD Components market size was estimated at USD 235.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.80% during the forecast period.
