### Report Overview

Vacuum Distillation Unit (VDU) receives the heavy bottoms from the atmospheric distillation unit (ADU) and further separates them with the benefit of vacuum pressure to prevent the cracking, or break down, of the oil. The VDU is composed of an outer shell, distillation columns and a fired heat exchanger. When fouled with heavy residuum, the efficiency of the heat exchange process declines, reducing throughput and flow rate, and can introduce hot spots in the system leading to coking of the oil in the VDU.
