Abstracts

An indwelling pleural catheter is a specialized medical device designed for the long-term management of recurrent malignant pleural effusions, a condition characterized by the abnormal accumulation of fluid in the pleural space surrounding the lungs. It consists of a small, flexible silicone tube that is inserted percutaneously into the pleural cavity, with one end remaining inside to facilitate drainage and an external end equipped with a one-way valve to prevent air or fluid backflow; this allows for intermittent, outpatient-based fluid removal, reducing the need for repeated hospitalizations and invasive procedures like thoracentesis or pleurodesis. The catheter is typically tunneled subcutaneously to minimize infection risk and enhance patient comfort, making it a valuable tool for palliative care in oncology patients seeking improved quality of life and symptom relief.

The global Indwelling Plural Catheters market size was estimated at USD 430.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.75% during the forecast period.
