Abstracts

Inertial motion capture system (or IMU-based motion capture) employs sensors embedded in the actor's equipment or clothing. These sensors, which include magnetometers, gyroscopes, and accelerometers, enable real-time monitoring of the body's orientation and movement. The primary advantages of inertial motion capture lie in its mobility and user-friendliness. It does not require an enclosed space with specific lighting conditions; thus, it can be utilized outdoors. However, due to sensor drift, inertial motion capture may not accurately record absolute position and orientation over extended periods.

The global Inertial Motion Capture (IMC) Systems market size was estimated at USD 150.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 10.20% during the forecast period.
