Abstracts

Inertial sensing encompasses a class of electronic devices and systems that measure and interpret motion, orientation, and gravitational forces without relying on external references, primarily through the integration of accelerometers, gyroscopes, and sometimes magnetometers. Inertial Measurement Units (IMUs) provide raw or filtered data on linear acceleration, angular rate, and magnetic field strength in three axes, while Inertial Navigation Systems (INS) combine IMU data with computational algorithms?often aided by GPS or other sensors?to continuously calculate position, velocity, and attitude through dead reckoning, making them critical in applications where external signals may be unavailable or unreliable. These technologies are fundamental across industries requiring precise motion tracking, stabilization, or autonomous operation.

The global Inertial Sensing (Imu, Ins) market size was estimated at USD 2368.97 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.45% during the forecast period.
