Abstracts

Inertial sensing systems are electronic devices or subsystems that measure and report a body's specific force, angular rate, and sometimes magnetic field orientation, using a combination of accelerometers, gyroscopes, and magnetometers. These systems operate without reliance on external references, making them capable of determining parameters such as position, orientation, and velocity in environments where GPS or other external signals are unavailable, degraded, or intermittent. They are fundamental to applications requiring precise motion tracking or stabilization, ranging from consumer electronics like smartphones and wearables to critical aerospace, defense, automotive, and industrial automation systems. The core technologies include Micro-Electro-Mechanical Systems (MEMS), fiber-optic gyroscopes (FOGs), and ring laser gyroscopes (RLGs), with MEMS-based solutions dominating high-volume commercial markets due to their cost-effectiveness and miniaturization, while higher-performance FOG and RLG systems are prevalent in demanding aerospace and military applications.

The global Inertial Sensing Systems market size was estimated at USD 4675.82 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 11.45% during the forecast period.
